

The preservation of natural resources is critical to Lodi's environmental quality, economic development and overall quality of life for its residents. Maintaining agricultural land stimulates the city and region's economy and aesthetic identity. The protection of biological resources and habitat encourages biodiversity and the viability of plant and animal life. Good water and air quality are essential for ensuring health and safety. And conserving energy helps to reduce greenhouse gas emissions and preserve non-renewing resources. In addition to natural resources, manmade historic resources, such as building and historical event sites, help to form the city's identity.

The Conservation Element establishes policies for the conservation of natural resources in Lodi. Topics addressed include agricultural and soil resources; biological resources; cultural and historic resources; hydrology and water quality; energy and climate change; and air quality. Water supply and conservation are addressed in Chapter 3: Growth Management and Infrastructure. Flooding and drainage are addressed in Chapter 8: Safety.

## 7.1 AGRICULTURAL AND SOIL RESOURCES

Agricultural activities play an important role in the city's economy, culture, and identity. Grapes, processed foods, nuts, fruit, and milk are all major commodities in the Planning area, with both established national and international markets. Wine grape growers in the Lodi area alone produce an annual crop with an estimated worth \$5 billion, which includes contributions from sales, wages, tourism, and other direct and indirect effects<sup>1</sup>. In addition to the direct contributions of agriculture, there are secondary economic impacts as well, including a food processing industry, winemaking and tourism (see the Economic Development section of Chapter 2: Land Use for details). This section provides an overview of agricultural and soil resources in the Planning Area, including land classified as Important Farmlands and/or containing Williamson Act contracts. Note that Chapter 8: Safety contains policies concerning soil resources as they relate to safety concerns (e.g. geology and seismicity).

### Soils

In 1992, a soil survey for San Joaquin County was conducted by the United States Department of Agriculture, Natural Resources Conservation Service, which creates maps of surface soils for use in land use decision making.

The Planning Area consists of a total of 25 different detailed soil types. Most soil types in the Planning Area are sandy loams (such as Tokay and Acampo), which are highly productive for agriculture and present little constraint to development. Limited acreages of additional types of soil types are also found throughout the Planning Area. The Tokay-Acampo soil group is characterized by moderately well-drained and well-drained, moderately coarse textured soils. The soils are deep to hardpan and located on low fan terraces. The primary detailed soil types present within this group include Tokay and Acampo. The Tokay soils are very deep and well drained. Typically, the surface layer and subsoil

are moderately coarse textured. The Acampo soils are 40 to 60 inches to a hardpan and are moderately well drained. The surface layer and subsoil are moderately coarse textured.

### Agriculture

#### *Important Farmlands within the Planning Area*

Farmland across the State is classified by the California Department of Conservation with respect to its potential for agricultural productivity. In 2004, an estimated 40,730 acres (roughly 80% of the total Planning Area) were designated for some type of agricultural use. As shown in Table 7-1 and Figure 7-1, lands designated as Prime Farmland account for an estimated 65% of the Planning Area.

### Agricultural Production

#### San Joaquin County

The 2007 Agricultural Report for San Joaquin County indicates that milk and grapes are the leading agricultural commodities in the county, with annual values of approximately \$466 million and \$217 million, respectively. The gross value of agricultural production for 2007 in San Joaquin County was estimated at \$2 billion, an all-time high.<sup>2</sup>

#### Lodi Planning Area

Within the Planning Area, 38,240 acres—approximately 75% of the total Planning Area—are currently in active agricultural production, with just 3% of land classified as “Idle” agricultural land. Table 7-2 identifies the type of crops within the Planning Area. Lands classified as vineyards account for a majority of the lands in agricultural production.

<sup>1</sup> Stonebridge Research. “Economic Impact of Wine and Grapes in Lodi 2009.” May 2009. Annual estimate for 2007.

<sup>2</sup> San Joaquin County Agricultural Commissioner's Office, 2007. Note that these values are estimates based on the most common method of sale for the commodities and do not include indirect effects or revenues.

**TABLE 7-1: LAND USE IN PLANNING AREA, BY FARMLAND MAP AND MONITORING PROGRAM DESIGNATION**

| <b>FMMP DESIGNATION</b>          | <b>DESCRIPTION</b>  | <b>ACRES</b> | <b>% OF PLANNING AREA</b> |
|----------------------------------|---|--------------|---------------------------|
| Prime Farmland                   | Land that has the best combination of physical and chemical characteristics for the production of crops.  | 32,926       | 65%                       |
| Farmland of Statewide Importance | Similar to Prime Farmland but with minor shortcomings, such as greater slopes or less ability to hold and store moisture.   | 1,911        | 4%                        |
| Unique Farmland                  | Land of lesser quality soils used for the production of specific high-economic value crops  | 4,442        | 9%                        |
| Farmland of Local Importance     | Land of importance to the local agricultural economy as determined by each county's board of supervisors and local advisory committee.  | 1,420        | 3%                        |
| Grazing Land                     | Land on which the existing vegetation is suited to the grazing of livestock.  | 31           | <1%                       |
| Urban and Built-Up Land          | Land occupied by structures with a building density of at least 1 unit to 1.5 acres, or approximately 6 structures to 10-acre parcel.   | 8,701        | 17%                       |
| Other Categories                 | Low-density rural developments; brush, timber, wetland, and riparian areas. Vacant and nonagricultural land surrounded on all sides by urban development and greater than 40 acres. | 1,400        | 3%                        |

**FIGURE 7-1: LODI FARMLANDS**

DRAFT

## Preservation and Conservation

### *Williamson Act*

The California Land Conservation Act of 1965, Sections 51200 et seq. of the California Government Code, commonly referred to as the Williamson Act, enables local governments to restrict the use of specific parcels of land to agricultural or related open space use. Landowners enter into contracts with participating cities and counties and agree to restrict their land to agriculture or open space use for a minimum of 10 years. Contracts are automatically renewed every year, for an additional year, unless a property owner initiates the non-renewal process which starts the nine-year non-renewal period, after which time the contract is terminated.

In August 1998, the Williamson Act's Farmland Security Zone (FSZ) provisions were enacted with the passage of Senate Bill 1182 (California Government Code Section 51296-51297.4). This sub-program, called the "Super Williamson Act," enables agricultural landowners to enter into contracts with a specific county for 20-year increments. Land restricted by an FSZ contract is valued for property assessment purposes at 65% of its Williamson Act valuation, or 65% of its Proposition 13 valuation, whichever is lower.

Figure 7-1 provides the locations of parcels within the Planning Area that have an active Williamson Act Contract (18,251 acres), a Williamson Act Contract in non-renewal status (124 acres), or a FSZ contract (1,343 acres).<sup>3</sup> The General Plan growth areas coincide with 927 acres of active contracts, 16 acres in non-renewal contracts and 37 FSZ contracts. General Plan policies support the continuation of Williamson Act contracts in anticipated urban growth areas, until the contracts have expired and the market is ready for urban development.

### *Farmland Conversion*

While one quarter of the gross new General Plan potential development area is infill and will not reduce the amount of farmland, some conversion of agricultural

Lodi's climate and soil is well suited for agricultural production—a key industry in the city's and region's economy

<sup>3</sup> Williamson Act contract mapping and analysis relies on the following sources: California Department of Conservation, Division of Land Resource Protection, Farmland Mapping and Monitoring Program. Sacramento, CA, 2004; Dyett & Bhatia, 2007; and ESA, 2007.

land to urban use is inevitable given Lodi's growth needs. If the General Plan were developed to maximum capacity, 2,893 acres of Prime Farmland would be replaced by urban development (including parks and open spaces). This area represents 69% of the new urban area delineated in the General Plan Land Use Diagram. The most prevalent crop types that would be displaced if the General Plan developed to its fullest potential are vineyards (1,676 acres), deciduous fruits and nuts (516 acres), and field crops (322 acres).

However, multiple policies are identified in this General Plan to prevent excessive agricultural land conversion, including prioritizing infill development within the existing City limits, compact development in new growth areas, and the continuation of the vast majority of agricultural activities in the Planning Area.

## 7.2 BIOLOGICAL RESOURCES

While a significant majority of the Planning Area is urbanized or in agricultural use, the Planning Area includes a variety of biological communities which provide habitat for both rare and common wildlife and plant species. This section describes biological resources existing or potentially occurring within the Planning Area.

### Wildlife Habitats

Wildlife habitats provide food, shelter, movement corridors, and breeding opportunities for wildlife species. More common wildlife species frequently use more than one habitat type—for example, riparian habitat for breeding sites, resting sites, cover while moving from one area to another, or thermal cover, and range into open upland grasslands, scrub, or over open water to forage. The Planning Area contains mostly human-modified habitats. A mosaic of smaller areas of lacustrine, wetland, riparian, grassland, and open water habitat types occur along the Mokelumne River and other waterways in the Planning Area. All of these habitats, as classified in California Wildlife Habitats, are listed in Table 7-3 and briefly described in the section below.<sup>4</sup>

---

<sup>4</sup> Mayer, Kenneth E. and W.F. Laudenslayer, Jr. "A Guide to Wildlife Habitats of California." State of California Resources Agency, Department of Fish and Game. Sacramento, CA, 1988.

Plan policies help to enable smooth transitions between urban and agricultural uses.

## Agricultural Areas

Vegetation composition and structure in agricultural habitats are variable, depending on the type of crops grown, timing of operational activities, and the time of year. For these reasons, habitat value for wildlife is also variable. Croplands provide food and water for these species, but do not generally provide long-term shelter due to the frequency of disturbance. Typical wildlife species that may use agricultural habitat include a variety of rodents—such as California ground squirrel (*Spermophilus beecheyi*) and California vole (*Microtus californicus*); and birds—such as red-winged blackbird (*Agelaius phoeniceus*), northern harrier (*Circus cyaneus*), white-tailed kite (*Elanus leucurus*), and yellow-billed magpie (*Pica nuttali*).

## Urban Areas

Wildlife species that use urban habitat are variable, depending on the density of development, the surrounding land use, and the types and availability of vegetation and other habitat features available for foraging, nesting, and cover. In general, wildlife habitat in urban areas consists of landscaped areas with a mix of both native and exotic ornamental plant species. Species using these areas are conditioned to a greater level of human activity than those in natural and less developed areas. Wildlife species typically found in urban habitat include American crow (*Corvus brachyrhynchos*), rock dove (*Columba livia*), American robin (*Turdus americana*), Brewer's blackbird (*Euphagus cyanocephalus*), house finch (*Carpodacus mexicanus*), house sparrow (*Passer domesticus*), northern mockingbird (*Mimus polyglottos*), mourning dove (*Zenaida macroura*), raccoon (*Procyon lotor*), Virginia opossum (*Didelphis virginiana*), and striped skunk (*Mephitis mephitis*).

## Annual Grassland

Annual grassland areas are generally surrounded by agricultural land, but may also border smaller areas of wetland or riparian habitat. Along the Mokelumne River, annual grassland habitats are interspersed with lacustrine and open water habitats as well. Annual grassland is typically composed of herbaceous exotic

**TABLE 7-3: HABITAT AND LAND USE ACREAGE FOR THE PLANNING AREA**

| LAND USE/HABITAT            | ACRES         | % OF PLANNING AREA |
|-----------------------------|---------------|--------------------|
| Agriculture                 | 41,110        | 81%                |
| Urban                       | 8,400         | 17%                |
| Annual Grassland            | 620           | 1%                 |
| Valley Foothill Riparian    | 350           | <1%                |
| Freshwater Emergent Wetland | 130           | <1%                |
| Lacustrine                  | 120           | <1%                |
| Water                       | 120           | <1%                |
| <b>Total</b>                | <b>50,850</b> | <b>100%</b>        |

Source: California Department of Forestry and Fire Protection 2002; San Joaquin County, 2003; Dyett & Bhatia, 2007; and ESA, 2007.

Agriculture land is the primary habitat type in the Planning Area (top). Lacustrine habitat is more limited; it supports aquatic life along the Mokelumne River and around Lodi Lake (bottom).

grasses and forbs, and may include weedy species such as perennial ryegrass (*Lolium perenne*), soft chess (*Bromus hordeaceus*), foxtail barley (*Hordeum murinum*), ripgut brome (*Bromus diandrus*), wild oats (*Avena* sp.), and stork's bill (*Erodium botrys*). Annual grassland habitats that contain or are adjacent to more complex habitats or habitat features (e.g. riparian) are more likely to have a greater habitat value and support a greater diversity of wildlife species. Wildlife species that use annual grassland include a variety of sparrows, white-tailed kite, northern harrier, red-tailed hawk, burrowing owl (*Athene cunicularia*), ring-necked pheasant (*Phasianus colchicus*), various rodents, lizards, snakes, and salamanders.

### **Valley Foothill Riparian**

Valley foothill riparian habitat consists of an overstory canopy of valley oak (*Quercus lobata*) and may include interior live oak (*Quercus wislizenii*), black walnut (*Juglans hindsii*) and boxelder (*Acer negundo*). Understory vegetation may include toyon (*Heteromeles arbutifolia*), wild grape (*Vitis californicus*), and Himalayan blackberry (*Rubus bicolor*). Riparian habitats can be complex in structure and composition, and abundant in wildlife diversity and richness. Many species of wildlife use this habitat type for movement corridors, foraging, cover, and breeding. Wildlife species that use valley foothill riparian habitat include black phoebe (*Sayornis nigris*), Nuttall's woodpecker (*Picoides nuttallii*), ruby-crowned kinglet (*Regulus calendulus*), red-shouldered hawk (*Buteo lineatus*), gray squirrel (*Sciurus griseus*), and raccoon.

### **Freshwater Emergent Wetland**

Freshwater emergent wetland is adapted to frequent inundation and ponding and includes hydrophilic emergent species such as common cattail (*Typha latifolia*) and tule rush (*Scirpus acutus*). Within the Planning Area, freshwater emergent wetland occurs in small patches adjacent to annual grassland, and can be surrounded by agricultural lands, or interspersed with a variety of other habitats along the Mokelumne River corridor. Wetland habitats provide habitat for wildlife species such as waterfowl and wading birds, blackbirds (*Agelaius* sp.),

amphibians, and reptiles such as garter snake (*Thamnophis* sp.) and pond turtle (*Emys marmorata*).

### **Lacustrine**

Lacustrine is an aquatic habitat type occurring in relatively small numbers predominately along the Mokelumne River. This habitat is limited within the Planning Area. Lacustrine habitat includes lakes, reservoirs, ponds, and ponded areas along streams. Permanent lacustrine habitats typically support fish species and also provides foraging, cover, and breeding habitat for other aquatic species such as pond turtle, amphibians, various waterfowl and piscivorous species such as belted kingfisher (*Ceryle alcyon*), great blue heron (*Ardea herodias*), and bald eagle (*Haliaeetus leucocephalus*).

### **Open Water**

Open water or riverine habitats in the Planning Area include the Mokelumne River, which runs through the northern portion of the Planning Area, and the White Slough Water Pollution Control Plant in the southwestern portion of the Planning Area along I-5. It is the least abundant habitat type in the Planning Area. Open water, like similar lacustrine habitat, provides habitat for a variety of fish and other aquatic or semi-aquatic species.

## **San Joaquin County Multi-Species Conservation and Open-Space Plan**

The San Joaquin County Multi-Species Conservation and Open-Space Plan (SJMSCP) is a habitat conservation plan that seeks to protect agriculture, open space, habitat, and wildlife, in order to address the impacts of urban development and conversion of open space land. The Plan outlines a voluntary strategy that developers and property owners can participate in to mitigate impacts of development. In 2001, the city of Lodi adopted the SJMSCP, thereby allowing project applicants to use this plan to mitigate open space conversions while satisfying CEQA requirements. Project applicants may: pay an in-lieu fee that mitigates cumulative impacts; dedicate habitat lands as conservation easement or fee title; purchase mitigation bank credits from a mitigation bank approved by SJMSCP; or propose an

alternative plan, consistent with the SJMSCP goals and equivalent in biological value.

In preparing the SJMSCP, land uses and habitats were mapped throughout the county, categorized into land use categories, and incorporated into a geographic information system database to help determine compensation fees. Many of the new urban areas defined by the General Plan are not included in the mapped extent for Lodi. Such projects will be subject to the Plan's "unmapped project process," which includes a case-by-case review by the Habitat Technical Advisory Committee. Table 7-4 identifies the amounts, general locations, and descriptions of the land use compensation zone categories.

## Special Status Species in the Planning Area

Special-status species are plants and animals that, because of their documented rarity or vulnerability to various causes of habitat loss or population decline, are recognized by federal, state, or other agencies. Some of these species receive specific protection that is defined by federal or state endangered species legislation. Others have been designated as "sensitive" on the basis of adopted policies and expertise of state resource agencies or organizations with acknowledged expertise, or policies adopted by local governmental agencies such as counties, cities, and special districts to meet local conservation objectives.

**TABLE 7-4: SAN JOAQUIN COUNTY MULTI-SPECIES CONSERVATION AND OPEN-SPACE PLAN LAND USE COMPENSATION ZONES WITHIN THE PLANNING AREA**

| LAND USE COMPENSATION ZONE      | BIOLOGICAL COMMUNITIES   | PLANNING AREA ACREAGE <sup>1</sup> | % OF PLANNING AREA |
|---------------------------------|--|------------------------------------|--------------------|
| Multi-Purpose Open Space        | Orchards, vineyards, and some water features                               | 21,820                             | 43%                |
| Agricultural Habitat Open Space | Perennial and annual croplands   | 18,590                             | 36%                |
| No-Pay Zone                     | Urban  | 8,710                              | 17%                |
| Natural Land                    | Riparian, vernal pool, grassland habitats, and some agricultural rangeland | 1,670                              | 3%                 |
| Vernal Pools                    | Vernal Pools   | 40                                 | < 1%               |
| <b>Total</b>                    |  | <b>50,830</b>                      | <b>100%</b>        |

<sup>1</sup> Total acreage for each land use compensation zone does not correspond entirely to the total acreage identified for each habitat described in Table 7-3.

San Joaquin County, 2003; Dyett & Bhatia, 2007; and ESA, 2007.

**TABLE 7-5: SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE PLANNING AREA**

| SCIENTIFIC NAME, COMMON NAME                             | STATUS             | GENERAL HABITAT   | SJMSCP COVERED? |
|--|--------------------|---|-----------------|
| <i>Branchinecta lynchi</i> ,<br>Vernal pool fairy shrimp | Federal Threatened | Lifecycle restricted to vernal pools.   | Yes             |
| <i>Buteo swainsoni</i> ,<br>Swainson's hawk              | State Threatened   | Forages in open plains, grasslands, and prairies; typically nests in trees or large shrubs. | Yes             |

Source: CNDDb, 2007; SJMSCP.

FIGURE 7-2: SENSITIVE SPECIES

A table in Appendix XXX identifies the complete list of special species that may be found in the Planning Area, their general habitat requirements, and whether or not the species is covered under the SJMSCP. Species covered by the SJMSCP are subject to the requirements for mitigation or compensation as identified in the SJMSCP or as required by federal and state regulations. As shown in Figure 7-2 and Table 7-5, two CNDDB-listed species, Swainson's hawk and vernal pool tadpole shrimp, may potentially occur within the current City limits and new growth areas.

### Habitat Conversion

Annual grassland and riparian habitats provide important advantages to several sensitive species in the Planning Area. Development in the Planning Area could eliminate or modify agricultural land and some riparian and seasonally wet grassland. However, the General Plan does not propose any development along the Mokelumne River where the most significant concentration of sensitive resources is located. Policies seek to minimize the disturbance of habitat and wildlife and avoid fragmentation of these resources through the development review process, site-specific biological studies, and by prioritizing contiguous urban development and open space planning.

## 7.3 CULTURAL RESOURCES

In addition to a desire by the local community to protect cultural resources, State laws, most notably CEQA, protect archaeological and other cultural resources.

**Cultural resources** are defined as buildings, sites, structures, or objects that may have historical, architectural, archaeological, cultural, or scientific importance. Information on cultural resources was obtained through archival research, contacts with knowledgeable people, and a reconnaissance-level field survey of the Planning Area.

**Archaeological resources** are places where human activity has measurably altered the earth or left deposits of physical remains. Archaeological resources may be either prehistoric (before the introduction of writing in a particular area) or historic (after the introduction of writing). The majority of such places in this region are associated with either Native American or Euroamerican occupation of the area.

**Contemporary Native American resources**, also called ethnographic resources, can include archaeological resources, rock art, and the prominent topographical areas, features, habitats, plants, animals, and minerals that contemporary Native Americans value and consider essential for the preservation of their traditional values.

### Prehistoric Context

Although the Planning Area may have been occupied by Native Americans for 12,000 years or longer, the evidence of early human use is likely buried by alluvial deposits that have accumulated during the last several thousand years. Reliable evidence from archaeological excavations indicates that this region of California has certainly been occupied for at least 6,000 years. Later periods are better understood because there is more representation in the archaeological record.

The ethnographically known people (the Native American people occupying the Planning Area at the time of contact with non-Native American peoples such as explorers and settlers) are called Northern Valley Yokut. The Northern Valley Yokut Indians held an

extensive region within north-central California, which ranged between the Diablo Mountain range to the west, the Sierra Nevada to the east, the north bend of the San Joaquin River to the south, and the Mokelumne River to the north. Semi-sedentary, the Yokuts lived in single-family dwellings and depended heavily on salmon, waterfowl and acorns for subsistence. Their technology included pottery, baskets, bow and arrow, bedrock mortars, pestles, portable mortars, and flaked stone tools. The Yokut traded with the Paiute and Shoshone to the east, Salinan and Coastanoan on the coast, and Miwok in the western central valley. (Wallace 1978)

## Existing Cultural Resources

Areas of relative cultural resource sensitivity can be identified based on the patterns that are reflected in the known site locations and by applying certain assumptions regarding the environmental factors that predict archaeological site locations. For instance, areas proximal to water sources, high ranking food resources, relatively flat slope aspect, and areas of social and political importance would be factors that would predict prehistoric use. In areas where comprehensive cultural resource surveys have not been undertaken—such as the current Planning Area where only six percent of the total area is estimated to have been surveyed—there is a general greater utility in the protection and management of the resources than presenting specific site locations.

According to the record search data and the foregoing assumptions, most prehistoric settlements within and surrounding the Planning Area were focused along the Mokelumne River and Bear Creek (southeast of Lodi). Although some areas have greater sensitivity than others for the presence of prehistoric or historic archaeological resources, it is possible to encounter archaeological deposits during ground-disturbing activities in almost any location.

### Prehistoric Archaeological Resources

The evidence from previous survey work and site investigations in the Planning Area indicate that prehistoric site types in unsurveyed portions of the Planning Area may include:

- Surface scatters of lithic artifacts and debitage associated with or without associated midden accumulations, resulting from short-term occupation, and/or specialized economic activities, or long-term occupation.
- Bedrock milling stations, including mortar holes and metate slicks, in areas where suitable bedrock outcrops are present.
- Petroglyphs and/or pictographs.
- Isolated finds of cultural origin, such as lithic flakes and projectile points.

### Historic Archaeological Resources

Historic archaeological site in portions of the Planning Area may include:

- Historic artifact scatters and buried deposits of historic debris and artifacts;
- Building foundations and associated deposits;
- Levees and roads; and
- Remains of farms and ranches.

## Native American Consultation

Cultural resource identification inquiries also included a letter to the Native American Heritage Commission requesting a review of the sacred lands file in regards to the Planning Area and a list of Native American contacts within the region. The Commission's February 13, 2007 response stated that the sacred lands files did not contain cultural resources information for the immediate Planning Area, but cautioned that absence of specific site information does not indicate the lack of cultural resources. The response also included eight contacts who have requested information on projects such as this and who may have knowledge of cultural resources within the Planning Area. On March 7, 2007, ESA sent letters to designated contacts with information about the proposed project and a request to contact staff if there were any questions or concerns.

Since that time, one letter had been received from Billie Blue Elliston of the Ione Band of Miwok Indians, who stated that their research indicated that the project may be within their tribe's ancestral territory and asked to remain informed about the project. On May 9, 2007, follow-up phone calls were made to the individuals and organizations identified by the Native American Heritage Commission. No additional information was obtained as a result of these calls.

## 7.4 HISTORIC RESOURCES

Historic resources are standing structures of historic or aesthetic significance. Architectural sites dating from the Spanish Period (1529-1822) through the post-World War II period (1945-1955) are generally considered for protection if they are determined to be historically or architecturally significant. Sites dating after the post-World War II period may also be considered for protection if they could gain significance in the future. Historic resources are often associated with archeological deposits of the same age. A records search of pertinent survey and site data at the Central California Information Center, California State University, Stanislaus, in February, 2007 [CCIC # 6606L] revealed known and recorded cultural resources within the Planning Area. An inventory of properties listed in the National Register of Historic Places (National Register), the California Register of Historic Resources (California Register), the California Inventory of Historic Resources (1976), the California Historical Landmarks (1996), the California Points of Historical Interest (1992 and updates), and the California Office of Historic Preservation (OHP) are also provided. Due to the extensive number of surveys and archaeological sites in the project vicinity, a comprehensive listing of the reports is not included. Rather, an example of the types of studies and archaeological sites is provided.

### Historic Setting

By the early 1800s, Spaniards had started exploring the area, adversely impacting the Native population. The 1848 Gold Rush further affected the Yokut population as white settlers began to inhabit the area permanently or travel through on their way to the gold fields in the Sierra Nevada. Lodi began in 1869 as the Town of Mokelumne, founded by the Central Pacific Railroad. The railroad connected Lodi with Sacramento to the north and Oakland and Stockton to the south, and the town was laid out parallel to the tracks. To avoid confusion with Mokelumne Hills and Mokelumne City, the townspeople changed the name to Lodi in 1874.<sup>5</sup>

Old images of Sacramento, School, and Lockeford streets.

Local industries, such as the Lodi Flouring Mill, and agriculture promoted further growth in the area. The Ivory Store, at the corner of Pine and Sacramento streets, was established in 1869, and other merchants soon followed with their businesses.<sup>6</sup> Access to rail transportation allowed crops and products to be transported throughout the country. Wheat and watermelons were the predominant crops throughout the nineteenth century.

In 1885, Japanese immigrants settled the area to work on ranches. Over time, they purchased lands and grew grapes. In the late 1890s German nationals settled Lodi and also participated in the grape industry. Flame Tokay grapes were first planted in the area in the late nineteenth century and by 1900, Lodi had over two million grape vines. In 1906, the City was incorporated, and held its first Tokay Carnival the next year, which would later evolve into the Lodi Grape Festival.<sup>7</sup> The Lodi Arch, which covers the gateway entrance to downtown, was built to commemorate the first Grape Festival in 1934.

Over the following century, Lodi grew from a population of 2,000 to over 60,000. In 1912 Lodi's first City Hall/fire station was built on Main Street. The current City Hall building was dedicated in 1928. In 1913, the Lodi Union High School opened for classes, and in 1919, entrepreneur Roy Allen brewed and sold his first batch of A&W Root beer in Lodi. Local farmers and wineries weathered the Prohibition Era well, growing grapes and shipping them out in secret for wine making. In 1956 the Federal Government officially acknowledges Lodi as a wine grape growing district. The City's continued growth led to the creation of numerous schools and public utilities and services throughout the second half of the twentieth century. Since the mid-1990s, the City has been involved in numerous restoration projects for its historic resources throughout the city, including the City Hall, the Lodi Arch, and the Southern Pacific Lodi Train Station.

## Historic Preservation Framework

### Federal Programs

#### *National Historic Preservation Act*

The National Historic Preservation Act (NHPA), enacted in 1966, established the National Register, authorized funding for state programs with participation by local governments, created the Advisory Council on Historic Preservation, and established a review process for protecting cultural resources. The NHPA provides the legal framework for most state and local preservation laws. The National Register is the Nation's official list of cultural resources worthy preservation. It is part of a national program to coordinate and support public and private efforts to identify, evaluate and protect historic and archaeological resources.

### State Programs

#### *California Register of Historical Resources*

The California Register was established in 1992, through amendments to the Public Resources Code, as an authoritative guide to be used by state and local agencies, private groups and citizens to identify the State's historical resources and to indicate what properties are to be protected from substantial adverse change. The California Register includes resources that are formally determined eligible for, or listed in, the National Register; State Historical Landmarks numbered 770 or higher; Points of Historical Interest recommended for listing by the State Historical Resources Commission (SHRC); resources nominated for listing and determined eligible in accordance with criteria and procedures adopted by the SHRC; and resources and districts designated as city or county landmarks when the designation criteria are consistent with California Register criteria.

Most of the city's historic structures, including the Women's Club (top) and Hotel Lodi (bottom) are located downtown.

City Hall (top), the Southern Pacific Train Station (middle), and the Lodi Arch (bottom) are some of the City's prized historic resources and restoration projects.

### *California Point of Historical Interest Program*

The California Point of Historical Interest Program was established in 1965 to recognize local historic properties not able to meet the restrictive criteria of the State Historical Landmarks program. The criteria for the Points are the same as those that govern the Landmark program, but are directed to local (city or county) areas. California Points of Historical Interest do not have direct regulatory protection, but are eligible for official landmark plaques and highway directional signs.

### *Mills Act Historic Property Contract*

State-enabling legislation, known as the Mills Act, allows jurisdictions to enter into contracts with private property owners of qualified historic properties to provide a property tax reduction in exchange for the owners agreeing to preserve, rehabilitate and maintain their historic properties. Mills Act historic property contracts always have provisions for rehabilitating a property with specifications for complying with the Secretary of the Interior's Standards for Rehabilitation. This property tax reduction is usually most beneficial to owners who have made recent purchases.

### **Local Preservation Ordinance**

A historic preservation ordinance is the primary tool used by municipalities to protect historic resources in a community. Local governments in California have authority to adopt a historic preservation ordinance to provide regulations regarding historic and cultural resources. Historic preservation ordinances are structured to address the particular needs and resources within a community.

While Lodi has several individual buildings on the National Register, it does not have any designated historic or conservation districts. Such districts would ensure that the overall neighborhood character of a neighborhood—within which individual buildings may not be designated, but which contribute to the overall character—are protected and enhanced. Establishing historic districts would help address issues of incompatible new construction and additions that have been occurring in some of the city's historic neighborhood. It would also address issues of public realm—such as streets, lamp posts, and trees—that contribute to the overall urban character of a district.

While delineation of historic districts is beyond the scope of the General Plan, the Plan provides the policy basis and direction for more detailed evaluation and delineation of historic districts, and a basis for implementing standards and guidelines for conservation of the character of historic districts. Within historic districts, key features such as building typology, streetscape, lighting, materials, and signage could be maintained and preserved. Regardless of inclusion in a historic district, the character of existing older neighborhoods should be preserved by ensuring that new infill development is consistent with the existing form.

## Existing Historic Resources

According to the record search data and the foregoing assumptions, most of the historically significant resources are clustered around the downtown area and in Woodbridge. Properties that are listed on or found eligible for listing in the National Register of Historic Places or which have not yet been evaluated for significance are presented in Table 7-6 and Figure 7-3. Lodi currently has six buildings in the National Register of Historic Places as well as several others that are eligible.

**TABLE 7-6: HISTORIC PROPERTIES IN LODI AND WOODBRIDGE**

| SITE/BUILDING                   | LOCATION                              | YEAR BUILT  | HISTORIC LANDMARK DESIGNATION | NATIONAL REGISTER STATUS   |

FIGURE 7-3: HISTORIC RESOURCES

## 7.5 HYDROLOGY AND WATER QUALITY

Lodi has several water resources within the Planning Area that contribute to the water supply and provide habitat for wildlife. This section discusses surface and groundwater resources and policies that seek to ensure that future development does not negatively impact water quality. For a discussion of water supply and conveyance as the city's population grows, see Chapter 3: Growth Management. Flooding and drainage is discussed in Chapter 8: Safety.

### Topography and Climate

The Planning Area is a low-lying, gently sloping former floodplain of the Mokelumne River that lies within six miles of the San Francisco Bay-San Joaquin River Delta (Delta). Elevations of the Planning Area range from about 50 feet above sea level along the river bank in the northeastern portion to about 25 feet in the southwest corner. The average slope is about 0.1-0.2 percent, with west-southwest aspect toward the Delta sloughs.

The climate in the Planning Area consists of long, dry, hot summers and mild winters. Between 1948 and 2006, the average annual temperature ranged from a low of 46 degrees Fahrenheit (°F) and a high of 74°F. Within this same time period, annual rainfall was approximately 18 inches.<sup>8</sup>

### Surface Water Resources

Small streams or creeks that pass through the Planning Area include Pixley Slough and Bear Creek, located in the southeastern portion of the Planning Area (see Figure 7-4). A number of canals and drainages are scattered throughout the Planning Area and in particular near the western boundary closer to the Delta. No other surface streams are recognized within the Planning Area.

Lodi Lake is located behind Woodbridge Dam on the Mokelumne River within the City's northern boundary. Lodi Lake also serves as a diversion for

Woodbridge Irrigation District's (WID) South Main Canal, providing irrigation waters to currently undeveloped lands in the western and southern portions of the Planning Area. The South Main Canal runs through the central portion of the Planning Area and within the existing City limits.

The Mokelumne River is the major waterway running through the northeastern portion of the Planning Area. This important waterway is located within the San Joaquin Valley watershed and drains about 660 square miles above the Planning Area and extends to 10,000 feet high in the Sierra Nevada. The Comanche Reservoir is located on the Mokelumne River approximately 20 miles northeast of the Planning Area.<sup>9</sup>

### Surface Water Quality

Impacts to water quality result from runoff during wet weather events, direct discharge associated with industrial/commercial activities and illicit dumping. Treated sewage generated in the Planning Area is eventually discharged to the San Joaquin River via the City's wastewater treatment facility, but the discharge is generally cleaner than the river water quality and is not considered a pollutant. Pollutant sources within the Planning Area may be generated from past waste disposal practices, agricultural chemicals, and chemicals and fertilizers applied to landscaping. Contaminants may include sediment, hydrocarbons and metals, pesticides, nutrients, bacteria, and trash.

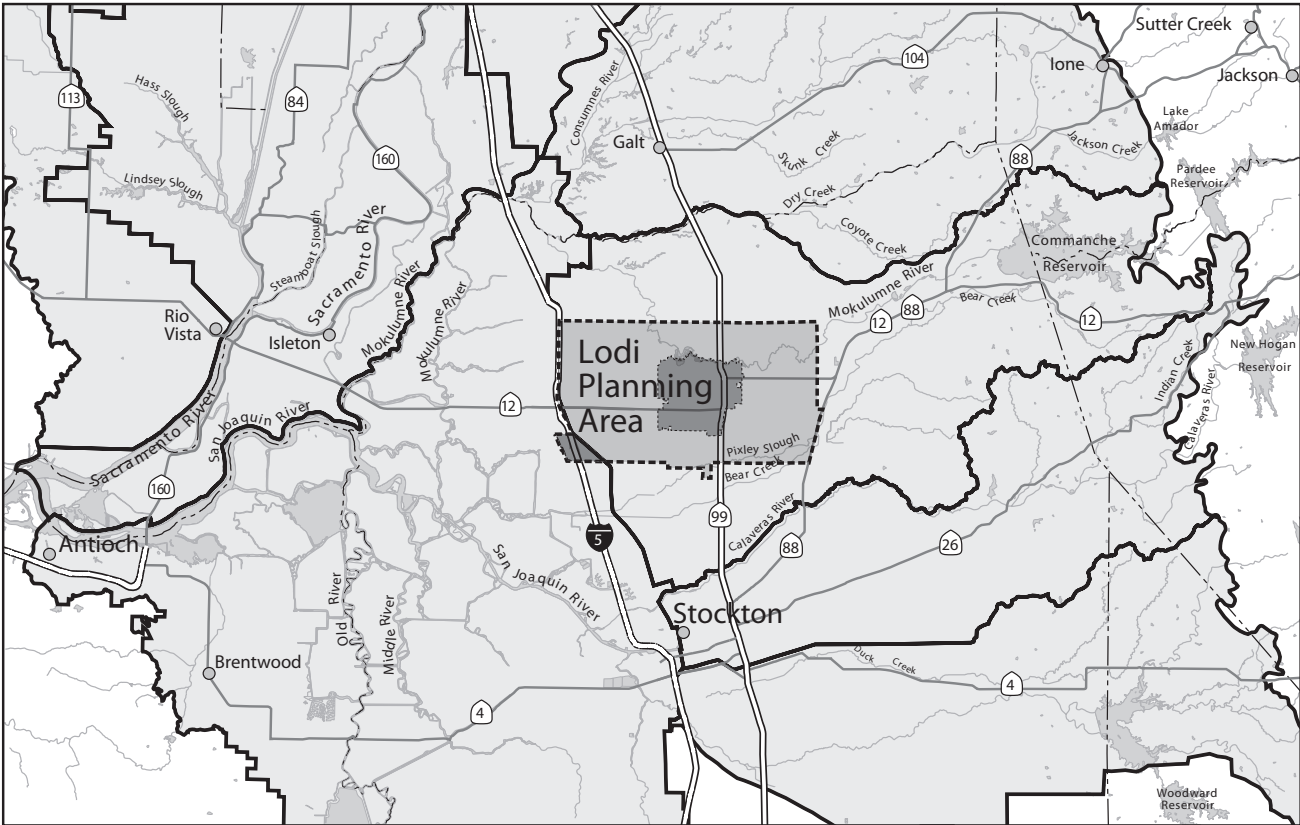

The State Water Resources Control Board (SWRCB), in compliance with the Clean Water Act, Section 303(d), has prepared a list of impaired water bodies in the State of California. As of 2006, the Lower Mokelumne River was listed as being impaired by zinc and copper. These contaminants likely originated upstream from the Planning Area from mining activities. The Central Valley Regional Water Quality Control Board is required to develop and implement a plan to lower the amounts of these contaminants in this water body to an acceptable level.<sup>10</sup>

FIGURE 7-4: REGIONAL WATERSHEDS AND WATERWAYS

- Watershed
- Waterway
- Lodi Planning Area
- Lodi City Limits

## Groundwater Resources

The Planning Area overlies the Eastern San Joaquin sub-basin of the greater San Joaquin Valley Groundwater Basin. Groundwater in the Planning Area is recharged by local precipitation and through percolation from surface waters. The Mokelumne River is the primary source of groundwater recharge in the Planning Area. The city of Lodi, as well as the entire Central Valley, is underlain by a vast thickness of alluvium that was derived from surrounding mountains, transported by the Mokelumne River and other streams, and deposited in shallow seas of river floodplains. This alluvium is now saturated below a relatively shallow depth. Thus, the sedimentary layers underlying the Planning Area are a part of the major aquifer system that extends throughout the Central Valley from Red Bluff to Bakersfield.<sup>11</sup>

## Groundwater Quality

### *Contaminants*

As the primary source of water supply for the city of Lodi, any potential water quality issues can seriously threaten the city's water supply. The four primary contaminants of concern are Dibromochloropropane (DBCP), Methyl-Tert-Butyl-Ether (MTBE), Tetrachloroethylene (PCE), and Trichloroethylene (TCE).

<sup>11</sup> Department of Water Resources, 2006.

Several of the City's wells are equipped with chlorination equipment intended to release controlled amounts of chlorine to help purify the water supply in the event of an emergency. Six of the City's wells utilize granular activated carbon to remove DBCP from the water. MTBE, PCE, and TCE have affected the groundwater supply to a lesser extent than DBCP. While PCE and TCE have been detected in some of the City's wells, the wells are still compliant with drinking water standards. Efforts to clean up the contamination are underway.<sup>12</sup>

### *Overdraft*

Over the past 40 years, pumping for municipal and industrial uses in eastern San Joaquin County has exceeded the basin's sustainable yield. This has caused groundwater elevations to decline at an average rate of 1.7 feet per year and has dropped by as much as 100 feet in some areas. Groundwater overdraft has reduced storage in the basin by as much as two million acre feet and caused groundwater depressions in the sub-basin east of Lodi. Overdrafting has the potential to decrease the water quality in the groundwater basin by allowing saltwater from the Delta to move into the basin underlying the western portion of the Planning Area.<sup>13</sup>

<sup>12</sup> City of Lodi, 2006.

Lodi Lake.

## 7.6 ENERGY AND CLIMATE CHANGE

This section describes climate change and its potential impacts on the city and region. It provides an overview of the energy and mineral resource sector, including the city's contributions to global climate change (GCC) and its energy conservation efforts to try to reduce greenhouse gas (GHG) emissions and the rate of GCC. Air quality is discussed separately, in Section 7.7, but also has a direct impact on GHG emissions, GCC, public health, and overall quality of life.

Although, oil, gas and mineral resources have been mined previously in the county and even within the Planning Area, currently there are no significant resources or extraction operations in the Planning Area.

### Global Climate Change

#### Greenhouse Gases

The Earth's atmosphere is naturally composed of gases that act like the glass panes of a greenhouse, retaining heat to keep the temperature of the Earth stable and hospitable for life at an average temperature of 60°F. Recently, elevated concentrations of these gases in the atmosphere have had a destabilizing effect on the global climate, fueling the phenomenon commonly referred to as GCC. GCC is defined as a change in the average weather of the earth that may be measured by wind patterns, storms, precipitation, and temperature. (See Section 2.7 for a detailed description of GHG emissions sources.)

#### Potential Impacts

According to the California Climate Action Team, accelerating GCC has the potential to cause a number of adverse impacts in California, including but not limited to: shrinking Sierra snowpack that would threaten the state's water supply; public health threats caused by higher temperatures and more smog; damage to agriculture and forests due to reduced water storage capacity, rising temperatures, increasing salt water intrusion, flooding, and pest infestations; critical habitat modification and destruction; eroding coastlines; increased

wildfire risk; and increased electricity demand. The IPCC predicts that global mean temperature increase from 1990-2100 could range from 2.0 to 11.5 °F. It projects a sea level rise of seven to 23 inches by the end of the century, with a greater rise possible depending on the rate of polar ice sheet melting. Just as GCC is a result of the cumulative impact of billions of actions at many levels, including the local and individual levels, the solution to GCC requires taking action at each of these levels.

### State Regulations

State regulations offer direction and regional and local goals and policy measures.

#### Executive Order S-3-05

Executive Order S-3-05, signed on June 1, 2005, recognized California's vulnerability to climate change, noting that increasing temperatures could potentially reduce snow pack in the Sierra Nevada, which is a primary source of the State's water supply. Additionally, according to this Order, climate change could influence human health, coastal habitats, microclimates, and agricultural yield. The Order set the GHG reduction targets for California: by 2010, reduce GHG emissions to 2000 levels; by 2020 reduce GHG emissions to 1990 levels; by 2050 reduce GHG emissions to 80 percent below 1990 levels.

#### California Global Warming Solutions Act of 2006

Assembly Bill (AB) 32 outlines measures by which the State and its businesses and residents can reduce heat-trapping emissions from a variety of sources, including mobile sources and stationary sources such as power plants and refineries. In addition to setting a binding limit on greenhouse gas emissions, AB 32 requires the California Air Resources Board (CARB), the State Energy Resources Conservation and Development Commission, and the California Climate Action Registry to jointly administer State policy specific to global warming issues.

In addition, AB 32 requires CARB to institute a mandatory emissions reporting and tracking system to

monitor compliance with the emissions limit. To that end, CARB adopted a scoping plan in December 2008 to guide the development of detailed regulations in accordance with AB 32. This plan includes local government targets to reduce emissions by 15% by 2020 over 2008 levels. GHG rules and market mechanisms adopted by CARB will take effect and are legally enforceable beginning in 2012. As a result, the plan seeks to limit GHG emissions to reduce global warming pollution by 145 million tons by 2020 or to 25 percent below forecasted emissions (reduced to 1990 levels by 2020).

### **Senate Bill 375**

Senate Bill (SB) 375 (Chapter 728, Statutes of 2008) links transportation and land use planning with the CEQA process to help achieve the GHG emission reduction targets set by AB 32. Regional transportation planning agencies are required to include a sustainable community strategy (SCS) in regional transportation plans. The SCS must contain a planned growth scenario that is integrated with the transportation network and policies in such a way that it is feasible to achieve AB 32 goals on a regional level. SB 375 also identifies new CEQA exemptions and stream lining for projects that are consistent with the SCS and qualify as Transportation Priority Projects.

## **Local Energy Resources and Conservation Efforts**

### **Sources and Service Providers**

Electrical service to the city is provided by the Lodi Electric Utility. The Lodi Electric Utility is a customer-owned and City-operated utility that provides electrical services for residential, commercial, and industrial customers in the city.

Since 1968, the Lodi Electric Utility has been a member of the Northern California Power Agency (NCPA), which is a California Joint Powers Authority comprised of seventeen public utilities. Through NCPA, Lodi Electric Utility is able to obtain electricity at cost, facilitating low energy prices for customers. The NCPA owns and operates a variety of electric generation

facilities, such that the Lodi has access to a variety of energy sources. In 2007, 53% of the city's power came from renewable energy sources, primarily geothermal and small and large hydroelectric; natural gas (29%) and coal (18%) composed the remaining power sources.<sup>14</sup>

Natural gas service for the Planning Area is provided by Pacific Gas and Electric Company (PG&E) and is piped from gas fields in Tracy and Rio Vista.

### **Energy and Mineral Resources**

Natural gas extraction used to be common within the Planning Area, but most wells are no longer in use. As of 2005, there were only 74 active wells in the county producing approximately 9,600,000 million cubic feet of natural gas.<sup>15</sup> Locally, the Lodi Gas field is located approximately one mile north of the northeastern corner of the Planning Area, buffered by agricultural land. Lodi Gas Storage, LLC utilizes wells in this field for gas storage. The 1,450-acre field was originally determined to be depleted in 1972. However, there are still large pockets of gas in two reservoirs. These reservoirs are now used to store gas, which is transported via a 33-mile long pipeline that runs along Acampo Road, the northern boundary of the Planning Area, from Lower Sacramento Road to Interstate-5. The pipeline connects the storage facility with two PG&E connections east of the Planning Area.<sup>16</sup>

The Planning Area does not contain significant mineral resources. The California Geological Survey's (formerly the Division of Mines and Geology) Special Report 160 identifies the classification of aggregate resources within the Stockton-Lodi Production-Consumption Region. According to this report, the Planning Area is designated as MRZ-1, meaning it is highly unlikely to contain significant mineral resources.<sup>17</sup>

<sup>16</sup> Jones and Stokes, 1999.

<sup>17</sup> California Division of Mines and Geology. Mineral Land Classification of Portland Cement Concrete Aggregate in the Stockton-Lodi Production-Consumption Region, Special Report 160. 1988.

## Energy Conservation

Reducing the carbon content of the fuel source and overall energy consumption can reduce GHG emissions and limit the negative impacts of GCC. The City currently administers and implements a variety of local energy conservation and waste reduction programs, including:

- Low-voltage LED lighting equipment in traffic signals.
- Solar assisted equipment at all new bus shelters/stops.
- Curbside recycling (which has allowed the city to meet the California Integrated Waste Management Act of 1989 requirement to divert at least 50% of waste from landfills).
- Energy education programs for children and students.
- Standards for photovoltaic panel installation.
- Lighting, heating, solar, and air conditioning rebate programs for residential and non-residential customers through the City's Electric Utility.

The General Plan seeks to reduce energy consumption through conservation efforts and renewable energy sources, as well as through land use, transportation, water, and green building and construction strategies, discussed elsewhere in the Plan.

## 7.7 AIR QUALITY

Good air quality is essential for protecting public health, ensuring a high quality of life, and maintaining a low rate of GHG emissions. However, located in the San Joaquin Valley Air Basin (SJVAB), Lodi is subject to air quality problems due to the SJVAB's unique topography and weather patterns. Therefore, a review of existing air quality sources and strategy for improvement is an essential component of the General Plan.

This section complies with AB 170 (an update to Government Code Section 65302.1) by providing existing conditions data (including attainment, and standards); local, district, state, and federal programs and regulations; and a comprehensive set of guiding and implementing policies. General Plan policy measures seek to reduce air quality impacts, in order to improve public health, reduce GHG emissions and enhance overall quality of life.

### Climate and Atmospheric Conditions

Air pollutant emissions overall are fairly constant throughout the year, yet the concentrations of pollutants in the air vary from day to day and even hour to hour. This variability is due to complex interactions of weather, climate, and topography. These factors affect the ability of the atmosphere to disperse pollutants. Conditions that move and mix the atmosphere help disperse pollutants, while conditions that cause the atmosphere to stagnate allow pollutants to concentrate. Local climatological effects, including topography, wind speed and direction, temperature, inversion layers, precipitation, and fog can exacerbate the air quality problem in the SJVAB.

### San Joaquin Valley Air Basin

The SJVAB is approximately 250 miles long and averages 35 miles wide, and is the second largest air basin in the state. The SJVAB is defined by the Sierra Nevada in the east (8,000 to 14,000 feet in elevation), the Coast Ranges in the west (averaging 3,000 feet in elevation), and the Tehachapi mountains in the south (6,000 to 8,000 feet in elevation). The valley is basically flat with a slight downward gradient to the northwest. The valley

opens to the sea at the Carquinez Straits where the San Joaquin-Sacramento Delta empties into San Francisco Bay. The San Joaquin Valley (Valley), thus, could be considered a “bowl” open only to the north.

## Wind Conditions and Air Pollutants

During the summer, wind speed and direction data indicate that summer wind usually originates at the north end of the Valley and flows in a south-southeasterly direction through the Valley, through Tehachapi pass, into the Southeast Desert Air Basin. In addition, the Altamont Pass also serves as a funnel for pollutant transport from the San Francisco Bay Area Air Basin into the region.

During the winter, wind speed and direction data indicate that wind occasionally originates from the south end of the Valley and flows in a north-northwesterly direction. Also during the winter months, the Valley generally experiences light, variable winds (less than 10 mph). Low wind speeds, combined with low inversion layers in the winter, create a climate conducive to high carbon monoxide (CO) and respirable and fine particulate matter (PM<sub>10</sub> and PM<sub>2.5</sub>, respectively) concentrations.

## Climate

The SJVAB has an “Inland Mediterranean” climate averaging over 260 sunny days per year. The valley floor is characterized by warm, dry summers and cooler winters. For the entire Valley, high daily temperature readings in summer average 95°F. Temperatures below freezing are unusual. Average high temperatures in the winter are in the 50s, but highs in the 30s and 40s can occur on days with persistent fog and low cloudiness. The average daily low temperature is 45°F.

The vertical dispersion of air pollutants in the Valley is limited by the presence of persistent temperature inversions. Solar energy heats up the Earth’s surface, which in turn radiates heat and warms the lower atmosphere. Therefore, as altitude increases, the air temperature usually decreases due to increasing distance from the source of heat. A reversal of this atmospheric state, where the air temperature increases with height, is termed an inversion. Inversions can exist at the surface or at any height above the ground, and tend to act as a lid on the Valley, holding in the pollutants that are generated here.

Cars and trains emit greenhouse gases, contributing to air quality impacts in the region.

## Policies, Programs, and Regulations

### Federal

At the federal level, the Environmental Protection Agency (EPA) has been charged with implementing national air quality programs. The EPA's air quality mandates are drawn primarily from the federal Clean Air Act (CAA). The federal CAA was first signed into law in 1963. Congress substantially amended the federal CAA in 1970, 1977, and 1990. The EPA sets federal standards for vehicle and stationary sources and provides research and guidance in air pollution programs.

#### *Federal Clean Air Act*

The federal CAA required the EPA to set National Ambient Air Quality Standards (NAAQS) for several problem air pollutants on the basis of human health and welfare criteria. The federal CAA requires air quality plans to include measures necessary to achieve these standards and requires that all City plans, programs and projects that require federal approval (including regional transportation plans), conform to air quality plans. Sanctions will apply if feasible measures are not expeditiously adopted.

Two types of NAAQS have been established: primary standards, which protect public health, and secondary standards, which protect public welfare (e.g., crops, forests, materials, visibility, etc.). Primary NAAQS have been established for the following criteria air pollutants: CO, ozone (O<sub>3</sub>), PM<sub>10</sub>, PM<sub>2.5</sub>, nitrogen dioxide (NO<sub>2</sub>), sulfur dioxide (SO<sub>2</sub>), lead (Pb).

All of the above, except CO, also have some form of secondary standard. The primary NAAQS standards are intended to protect, within an adequate margin of safety, those persons most susceptible to respiratory distress, such as people suffering from asthma or other illness, the elderly, very young children, or others engaged in strenuous work or exercise.

#### *Transportation Funding and Programs*

In addition to setting health-based standards for air pollutants, the EPA also oversees state and local actions to

improve air quality. The Intermodal Surface Transportation Efficiency Act requires transportation projects to not impact the ability to attain air quality standards and requires demonstration of expeditious implementation of Transportation Control Measures (TCM). In addition, Federal Transportation Funding Reauthorization provides funding for transportation projects that enhance air quality and for expeditious implementation of TCMs included in air quality plans.

### State

States are required to develop and implement air pollution control plans designed to achieve and maintain the NAAQS established by the EPA. States may also establish their own standards, provided the state standards are at least as stringent as the NAAQS. California has established California Ambient Air Quality Standards (CAAQS) pursuant to Health and Safety Code Section 39606(b) and its predecessor statutes.

The California Legislature established CARB in 1967. CARB is the agency responsible for coordination and oversight of state and local air pollution control programs in California and for implementing the California Clean Air Act (CCAA) of 1988. Other CARB duties include monitoring air quality in conjunction with air monitoring networks maintained by air pollution control districts (APCDs) and air quality management districts (AQMDs), establishing CAAQS (which are more stringent than the NAAQS in many cases), setting emissions standards for new motor vehicles, and reviewing district input for the State Implementation Plan (SIP) required by the federal CAA amendments. The SIP consists of the emissions standards for vehicular sources set by the ARB as well as attainment plans adopted by the APCD or AQMD and approved by the ARB, with objective of attain the NAAQS.

The State of California, through the CARB and Bureau of Automotive Repair, develops programs to reduce pollution from vehicles and consumer products. The following list provides a brief explanation of important regulations set forth by the State of California.

### *California Clean Air Act*

The CCAA provides a planning framework for attainment of the CAAQS for ozone, CO, SO<sub>2</sub>, and NO<sub>2</sub>. The CCAA classifies ozone nonattainment areas as moderate, serious, severe, and extreme based on severity of violation of state ambient air quality standards. For each class, the CCAA specifies air quality management strategies that must be adopted. For all nonattainment categories, attainment plans are required to demonstrate a five-percent-per-year reduction in nonattainment air pollutants or their precursors, averaged every consecutive three-year period, unless an approved alternative measure of progress is developed. Air districts responsible for air basins with air quality that is in violation of CAAQS for ozone, CO, SO<sub>2</sub>, and NO<sub>2</sub> are required to prepare an air quality attainment plan that lays out a program to attain the CCAA mandates.

The CCAA requires all feasible control measures, including TCM, to reduce emissions; provides for indirect source programs in attainment plans; and contains targets for emission reductions, vehicle miles traveled, and average vehicle ridership.

### *Assembly Bill 170*

In adding Section 65302.1 to the Government Code, AB 170 requires cities and counties in the Valley to incorporate strategies to improve air quality in their general planning efforts.

### *Senate Bill 709*

Senate Bill 709 adds Chapter 5.7 to Part 3 of Division 26 of the Health and Safety Code, giving the San Joaquin Valley Air Pollution Control District (SJVAPCD) more responsibility in terms of permitting, fee implementation, and agricultural assistance, but also gives the District the authority to require the use of best available control technology for existing sources, promote cleaner-burning alternative fuels, and encourage and facilitate ridesharing. It also adds Section 9250.16 to the Vehicle Code to allow the District to adopt a surcharge on motor vehicle registration fees.

Using renewable energy resources, such as solar, and planting trees can help reduce air quality impacts and ensure the health and safety of the community.

### *California Government Code Section 65089*

This section of the Government Code requires trip reduction and travel demand management in Congestion Management Programs.

### **Regional**

Air pollution does not follow political boundaries. Therefore, many air quality problems are best managed on a regional basis. In 1991, the State Legislature determined that management of an air basin by a single agency would be more effective than management through each county within that basin. Air basins are geographic areas sharing a common “air-shed.” Most major metropolitan areas in California now fall under the authority of multi-county APCDs or AQMDs.

Air districts have the primary responsibility for control of air pollution from all sources other than direct motor vehicle emissions, which are the responsibility of CARB and EPA. Air districts adopt and enforce rules and regulations to achieve state and federal ambient air quality standards and enforce applicable state and federal law.

### *San Joaquin Valley Air Pollution Control District*

The SJVAPCD has jurisdiction over air quality matters in the SJVAB. Until the passage of the CCAA, the primary role of county APCDs was controlling stationary sources of pollution, such as industrial processes and equipment. With the passage of the CCAA and federal CAA amendments, air districts were required to implement transportation control measures and were encouraged to adopt indirect source control programs to reduce mobile source emissions. These mandates created the necessity for air districts to work closely with cities, counties, and regional transportation planning agencies to develop new programs.

The SJVAPCD entered into a memorandum of understanding with the transportation planning agencies of the eight counties in the SJVAB in 1992. This memorandum of understanding ensures a coordinated approach in the development and implementation of transportation plans throughout the Valley. This action has helped the Regional Transportation Planning Agencies comply

with pertinent provisions of the federal and state Clean Air Acts as well as related transportation legislation (such as the Intermodal Surface Transportation Efficiency Act).

The SJVAPCD develops plans and implements control measures in an effort to advance Valley attainment of CAAQS and NAAQS. The District has developed plans to attain state and federal standards for ozone and particulate matter. The SJVAPCD’s air quality plans include emissions inventories to measure the sources of air pollutants, to evaluate how well different control methods have worked, and to show how air pollution will be reduced. The plans also use computer modeling to estimate future levels of pollution and make sure that the Valley will meet air quality goals on time. The SJVAPCD Governing Board approved three major plans in 2007-2008:

### *2007 Ozone Plan*

This plan includes an in-depth analysis of all possible control measures and projected that the Valley will achieve the 8-hour ozone standard (as set by EPA in 1997) for all areas of the SJVAB no later than 2023. This plan went above and beyond minimum legal requirements by including a “Fast Track” control strategy. Through Fast Track, new strategies produce real reductions (even though they cannot be legally counted in the plan at this time) and will clean the air before the deadline. The ARB approved the 2007 Ozone Plan on June 14, 2007.

### *2007 PM<sub>10</sub> Plan*

The SJVAPCD has compiled a series of PM<sub>10</sub> plans, with the first one in 1991. Based on PM<sub>10</sub> measurements from 2003-2006, EPA found that the SJVAB had reached the federal PM<sub>10</sub> standard. The SJVAPCD’s 2007 PM<sub>10</sub> Maintenance Plan assures that the Valley will continue to meet the PM<sub>10</sub> standard and requests that EPA formally redesignate, or label, the Valley to attainment status. On April 5, 2008, EPA stated their intent to approve the PM<sub>10</sub> Maintenance Plan.

### *2008 PM<sub>2.5</sub> Plan*

Building upon the strategy used in the 2007 Ozone Plan, the SJVAPCD agreed to additional control measures to reduce directly produced PM<sub>2.5</sub>. The 2008 PM<sub>2.5</sub> Plan estimates that the SJVAB will reach the PM<sub>2.5</sub> standard (as set by EPA in 1997) in 2014. The ARB approved the Plan on May 22, 2008, and the plan has been submitted to EPA.

### *District Tools*

The SJVAPCD has prepared guidance documents to aid agencies in performing environmental reviews. The documents are briefly described below:

- **Air Quality Guidelines for General Plans (AQGGP):** The AQGGP is a guidance and resource document for cities and counties to use to address air quality in their general plans. The AQGGP includes goals, policies, and programs to reduce vehicle trips, reduce miles travelled, and improve air quality.
- **Guideline for Assessing and Mitigating Air Quality Impacts (GAMAQI):** The GAMAQI is an advisory document, that provides Lead Agencies, consultants, and project applicants with uniform procedures for addressing air quality in environmental documents.
- **Environmental Review Guideline (ERG):** The ERG fulfills CEQA requirements for agencies to adopt procedures and guidelines for implementing CEQA. The document is intended to guide District staff in carrying out CEQA and to assure the public that environmental impacts related to District actions are thoroughly and consistently addressed.
- **Transportation Infrastructure:** The federal CAA amendments require transportation plans to conform to the air quality goals of the SIP. This means that states must assure that transportation programs do not undermine the attainment of air quality standards. The Regional Transportation Planning Agencies are responsible for making the conformity finding. The Air District's role in this process is one of consultation.
- **Air Quality Programs:** The CCAA allows air districts to delegate the implementation of transportation control measures to any local agency as long as the following conditions are met: (1) the agency must submit an implementation plan to the district for approval; (2) the agency must adopt and implement measures at least as stringent as those in the district's plan; and (3) the district must adopt procedures for reviewing the performance of the local agency in implementing the measures.

### *San Joaquin Council of Governments*

In addition, SJCOG is expected to take on a collaborative role in climate change and air quality planning, as a result of SB 375. As the region's metropolitan planning organization, SJCOG will be required to prepare an SCS to reduce vehicle miles traveled in the regions and demonstrate the ability for the region to attain CARB's targets. (See Section 2.6, for details on SB 375 and related bills). CARB is expected to finalize targets by September 2010.

### **Local**

Local government's responsibility for air quality increased significantly with the passage of the CCAA and the federal CAA amendments. The SJVAPCD is required to address state air quality standards by way of TCMs and indirect source programs in its air quality attainment plans; but, cities and counties, through their Councils of Government, are responsible for most implementation.

Local government responsibilities for air quality include:

1. **Land use planning:** the data, analysis, and the guiding and implementing policies identified in this General Plan;
2. **Environmental Review:** reviewing and mitigating the environmental impacts of development projects;
3. **Transportation:** developing and maintaining the transportation infrastructure in the community, including transit systems and bicycle networks;

4. Local programs: implementing local air quality programs such as commute-based trip reduction and rideshare.
5. GHG emissions reduction: reducing emissions, pursuant to AB 32 and SB 375, as regional targets are defined by CARB and local targets by SJCOG.

## Attainment Status

CARB and the EPA have established criteria air pollution standards in an effort to protect human health and welfare. Geographic areas are deemed “attainment” if these standards are met or nonattainment if they are not met. Nonattainment status is classified by the severity of the nonattainment problem, with marginal, moderate, serious, severe, and extreme nonattainment classifications for ozone. Nonattainment classifications for PM range from marginal to serious.

The SIP is a living document that is periodically modified to reflect the latest emissions inventories, planning documents, rules, and regulations of Air Basins as reported by the agencies with jurisdiction over them. The EPA reviews SIPs to determine if they conform to the mandates of the federal CAA amendments and will achieve air quality goals when implemented. If the EPA determines a SIP to be inadequate, it may prepare a Federal Implementation Plan for the nonattainment area and impose additional control measures.

At the federal level the District is currently designated as serious nonattainment for the 8-hour ozone standard, attainment for PM<sub>10</sub> and CO, and nonattainment for PM<sub>2.5</sub>. A new finding of “extreme” nonattainment with the 8-hour ozone standard is currently pending, and is expected to be approved by the federal EPA in 2009. At the state level the District is designated as nonattainment for the 8-hour ozone, PM<sub>10</sub>, and PM<sub>2.5</sub> standards.

## Existing Emission Sources and Emission Levels

### Criteria Pollutants

In general, primary pollutants are directly emitted into the atmosphere, and secondary pollutants are formed by chemical reactions in the atmosphere. Air pollution in the Valley results from emissions generated in the Valley as well as from emissions and secondary pollutants transported into the Valley. It is thought that the bulk of the Valley’s summer and winter air pollution is caused by locally generated emissions. Due to the Valley’s meteorology, topography, and the chemical composition of the air pollutants, NO<sub>x</sub> is the primary culprit in the formation of both ozone and PM<sub>2.5</sub>.

The SJVAPCD’s Annual Report to the Community, October 2008 provides a brief discussion of sources of air pollution and identifies the top sources of emissions in the SJVAB, as shown in Table 7-7.

**TABLE 7-7: TOP 10 SOURCES CRITERIA POLLUTANT EMISSIONS**

| NOX                              | VOC                            | PM2.5                          |
|----------------------------------|--------------------------------|--------------------------------|
| Heavy Heavy-Duty Diesel Trucks   | Farming Operations             | Managed Burning and Disposal   |
| Off-Road Equipment               | Oil and Gas Production         | Residential Fuel Combustion    |
| Farm Equipment                   | Consumer Products              | Farming Operations             |
| Trains                           | Pesticides/Fertilizers         | Heavy Heavy-Duty Diesel Trucks |
| Medium Heavy Duty Diesel Trucks  | Light Duty Passenger Vehicles  | Fugitive Windblown Dust        |
| Light Duty Passenger Vehicles    | Heavy Heavy-Duty Diesel Trucks | Paved Road Dust                |
| Light Duty Trucks – LDT2         | Off-Road Equipment             | Unpaved Road Dust              |
| Food and Agricultural Processing | Recreational Boats             | Cooking                        |
| Oil and Gas Production           | Light Duty Trucks – LDT2       | Off-Road Equipment             |
| Medium Duty Trucks               | Food and Agriculture           | Chemical Industrial Processes  |

## Greenhouse Gases

GHGs are gases that absorb and emit radiation within the thermal infrared range, trapping heat in the earth's atmosphere. There are no "attainment" concentration standards established by the federal or state government for greenhouse gases. In fact, GHGs are not generally thought of as traditional air pollutants because greenhouse gases, and their impacts, are global in nature, while air pollutants affect the health of people and other living things at ground level, in the general region of their release to the atmosphere<sup>18</sup>. Common GHGs include water vapor, carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), nitrous oxide (N<sub>2</sub>O), ozone (O<sub>3</sub>), and chlorofluorocarbons (CFCs). Some greenhouse gases occur naturally and are emitted to the atmosphere through both natural processes and human activities. Other GHGs are created and emitted solely through human activities. The principal greenhouse gases that enter the atmosphere because of human activities are CO<sub>2</sub>, CH<sub>4</sub>, N<sub>2</sub>O, and fluorinated carbons.

## Emission Levels

The SJVAPCD's regional air quality monitoring network provides information on existing ambient concentrations of criteria air pollutants. Monitored ambient air pollutant concentrations reflect the number and strength of emissions sources and the influence of topographical and meteorological factors. Table 7-8 presents a five-year summary of air pollutant (concentration) data collected at the three monitoring stations in the vicinity of the project area on Hazelton Street, East Mariposa Road, and at the Wagner-Holt School in Stockton. The Hazelton Street station measures concentrations of all air pollutants, including the two for which the SJVAB remains "nonattainment", ozone, PM<sub>10</sub>, and PM<sub>2.5</sub>. The East Mariposa Road Station measures ozone concentrations only and has not been collecting data for the last four years. The Wagner-Holt School Station measures PM<sub>10</sub> concentrations only. Pollutant concentrations measured at these stations should be representative of background air pollutant concentrations at or near the

Planning Area. These measured air pollutant concentrations are then compared with state and national ambient air quality standard.

---

<sup>18</sup> In April 2007, the U.S. Supreme Court concluded (*Massachusetts v. EPA*) that GHGs meet the CAA definition of an air pollutant, and are thus subject to regulation by EPA.

**TABLE 7–8: SUMMARY OF MONITORING DATA FOR THE NEAREST STATIONS TO THE PLANNING AREA 2002–2006**

| POLLUTANT   | STATE STANDARD | NATIONAL STANDARD | POLLUTANT CONCENTRATION BY YEAR <sup>1</sup> |       |       |       |       |

| Carbon Monoxide (Hazelton Street)                     |                |                   |  |       |       |       |       |
| Highest 8-hour average, ppm                           | 9.0            | 9                 | 3.2  | 3.1   | 2.5   | 2.9   | 2.2   |
| Days over Standard                                    |                |                   | 0  | 0     | 0     | 0     | 0     |

NOTE: Bold values are in excess of applicable standard. NA = Not Applicable or Not Available.

1. Data was collected at the Hazelton Street monitoring station unless otherwise noted. The E Mariposa Road station monitors for ozone only.

2. ppm = parts per million; µg/m<sup>3</sup> = micrograms per cubic meter.

3. This concentration was approved by the Air Resources Board on April 28, 2005 and became effective May 17, 2006.

Source: California Air Resources Board, Summary of Air Quality Data, 2006b, Gaseous and Particulate Pollutants, 2002, 2003, 2004, 2005, and 2006 data are from the ARB web site at <www.arb.ca.gov/adam>.

## 7.8 POLICIES

### GUIDING POLICIES

- C-G1** Promote preservation and economic viability of agricultural land surrounding Lodi.
- C-G2** Maintain the quality of the Planning Area's soil resources and reduce erosion to protect agricultural productivity.
- C-G3** Protect sensitive wildlife species and their habitats.
- C-G4** Protect, restore and enhance local water-courses and associated plant, wildlife, and fish species, particularly in the Mokelumne River and floodplain areas.
- C-G5** Encourage the identification, protection, and enhancement of archaeological resources.
- C-G6** Preserve and enhance districts, sites, and structures that serve as significant, visible connections to Lodi's social, cultural, economic, and architectural history.
- C-G7** Promote community awareness and appreciation of Lodi's history, culture and architecture.
- C-G8** Protect and improve water quality in the Mokelumne River, Lodi Lake, and major drainage ways.
- C-G9** Conserve energy and reduce per capita energy consumption.
- C-G10** Reduce greenhouse gas emissions by 15% over 2008 levels by 2020, to slow the negative impacts of global climate change.
- C-G11** Support land use, transportation management, infrastructure, and environmental planning programs that reduce vehicle emissions and improve air quality.
- C-G12** Minimize the adverse effects of construction related air quality emissions and Toxic Air Contaminants on human health.

### IMPLEMENTING POLICIES

#### Agricultural and Soil Resources

- C-P1** Work with San Joaquin County and the City of Stockton to maintain land surrounding Lodi in agricultural use. Encourage the continuation of Flag City as a small free-way-oriented commercial node, with no residential uses.
- C-P2** Work with San Joaquin County and relevant land owners to ensure economic viability of grape growing, winemaking, and supporting industries, to ensure the preservation of viable agricultural land use.
- C-P3** Support the continuation of agricultural uses on lands designated for urban uses until urban development is imminent.
- C-P4** Encourage San Joaquin County to conserve agricultural soils, preserve agricultural land surrounding the City and promote the continuation of existing agricultural operations, by supporting the county's economic programs.
- C-P5** Ensure that urban development does not constrain agricultural practices or adversely affect the economic viability of adjacent agricultural practices. Use appropriate buffers consistent with the recommendations of the San Joaquin County Department of Agriculture (typically no less than 150 feet) and limit incompatible uses (such as schools and hospitals) near agriculture.
- C-P6** Require new development to implement measures that minimize soil erosion from wind and water related to construction and urban development. Measures may include:
  - Construction techniques that utilize site preparation, grading, and best management practices that provide erosion control and prevent soil contamination.
  - Tree rows or other windbreaks shall be used within buffers on the edge of urban development and in other areas as appropriate to reduce soil erosion.

**C-P7** Maintain the City's Right-to-Farm Ordinance, and update as necessary, to protect agricultural land from nuisance suits brought by surrounding landowners.

**C-P8** Adopt an agricultural conservation program (ACP) establishing a mitigation fee to protect and conserve agricultural lands:

- The ACP shall include the collection of an agricultural mitigation fee for acreage converted from agricultural to urban use, taking into consideration all fees collected for agricultural loss (i.e., AB1600). The mitigation fee collected shall fund agricultural conservation easements, fee title acquisition, and research, the funding of agricultural education and local marketing programs, other capital improvement projects that clearly benefit agriculture (e.g., groundwater recharge projects) and administrative fees through an appropriate entity ("Administrative Entity") pursuant to an administrative agreement.

- The conservation easements and fee title acquisition of conservation lands shall be used for lands determined to be of statewide significance (Prime or other Important Farmlands), or sensitive and necessary for the preservation of agricultural land, including land that may be part of a community separator as part of a comprehensive program to establish community separators.
- The ACP shall encourage that conservation easement locations are prioritized as shown in Figure 7-5:
  - (A) the Armstrong Road Agricultural/Cluster Study area east of Lower Sacramento Road;
  - (B) the Armstrong Road Agricultural/Cluster Study area west of Lower Sacramento Road;
  - (C) elsewhere in the Planning Area, one mile east and west of the Urban Reserve boundaries respectively; and
  - (D) outside the Planning Area, elsewhere in San Joaquin County.

**FIGURE 7-5: CONSERVATION EASEMENT PRIORITY LOCATION**

DRAFT

- The mitigation fees collected by the City shall be transferred to a farmland trust or other qualifying entity, which will arrange the purchase of conservation easements. The City shall encourage the Trust or other qualifying entity to pursue a variety of funding sources (grants, donations, taxes, or other funds) to fund implementation of the ACP.

## Biological Resources

- C-P5** Support the protection, preservation, restoration, and enhancement of habitats of State or federally-listed rare, threatened, endangered and/or other sensitive and special status species, and favor enhancement of contiguous areas over small segmented remainder parcels.
- C-P6** Continue to coordinate with the San Joaquin Council of Governments and comply with the terms of the Multi Species Habitat Conservation and Open Space Plan to protect critical habitat areas that support endangered species and other special status species.
- C-P7** Work with other agencies to ensure that the spread of invasive/noxious plant species do not occur in the Planning Area. Support efforts to eradicate invasive and noxious weeds and vegetation on public and private property.
- C-P8** Protect the river channel, pond and marsh, and riparian vegetation and wildlife communities and habitats in the Mokelumne River and floodplain areas. Prohibit any activity that will disturb bottom sediments containing zinc deposits in Mokelumne River, because such disturbance could cause fish kills. Prohibit activities that could disturb anadromous fish in the Mokelumne River during periods of migration and spawning.
- C-P9** Support the protection, restoration, expansion, and management of wetland and riparian plant communities along the Mokelumne River for passive recreation, groundwater recharge, and wildlife habitat.

- C-P10** Explore the purchase of or establishment of a joint agreement for open space preservation and habitat enhancement in the Woodbridge Irrigation District's property located north of the Mokelumne River. Ensure the open space preservation and enhancement of this property, while exploring opportunities for public access.

- C-P11** Site new development to maximize the protection of native tree species and sensitive plants and wildlife habitat. Minimize impacts to protect mature trees, Swainson's hawk, vernal pool tadpole shrimp, and any threatened, endangered or other sensitive species when approving new development. Mitigate any loss.

- C-P12** Work with the California Department of Fish and Game in identifying an area or areas suitable for Swainson's hawk and burrowing owl habitat. Preserve land through a mitigation land bank to mitigate impacts on existing habitat for these species. Establish a mechanism for developer funding for the acquisition and management of lands in the mitigation bank.

## Cultural Resources

- C-P13** For future development projects on previously un-surveyed lands, require a project applicant to have a qualified archeologist conduct the following activities: (1) conduct a record search at the Central California Information Center at the California State University, Stanislaus, and other appropriate historical repositories, (2) conduct field surveys where appropriate and required by law, and (3) prepare technical reports, where appropriate, meeting California Office of Historic Preservation Standards (Archeological Resource Management Reports).
- C-P14** In the event that archaeological/paleontological resources are discovered during site excavation, the City shall require that grading and construction work on the project site be suspended until the significance of the features can be determined

by a qualified archaeologist/paleontologist. The City will require that a qualified archeologist/paleontologist make recommendations for measures necessary to protect any site determined to contain or constitute an historical resource, a unique archaeological resource, or a unique paleontological resource or to undertake data recovery, excavation, analysis, and curation of archaeological/paleontologist materials. City staff shall consider such recommendations and implement them where they are feasible in light of project design as previously approved by the City.

- C-P15** If any human remains are discovered or recognized in any location on the project site, there shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until:
- The San Joaquin County Coroner/Sheriff has been informed and has determined that no investigation of the cause of death is required; and
  - If the remains are of Native American origin: (1) the descendants of the deceased Native Americans have made a timely recommendation to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriate dignity, the human remains and any associated grave goods as provided in Public Resources Code Section 5097.98, or (2) The Native American Heritage Commission was unable to identify a descendant or the descendant failed to make a recommendation within 24 hours after being notified by the commission.

## Historic Resources

- C-P16** Encourage the preservation, maintenance, and adaptive reuse of existing historic buildings by developing incentives for owners of historically-significant buildings to improve their properties.
- C-P17** Require that, prior to the demolition of a historic structure, developers offer the structure for relocation by interested parties.
- C-P18** Require that environmental review consistent with the California Environmental Quality Act be conducted on demolition permit applications for buildings designated as, or potentially eligible for designation as, historic structures.
- C-P19** Conduct a comprehensive survey of historic resources in Lodi, including consideration of potentially eligible historic resources. Update Figure 7-3 upon completion of the survey.

Designate a structure as historic if it:

- Exemplifies or reflects special elements of the city's cultural, architectural, aesthetic, social, economic, political, artistic, and/or engineering heritage;
- Is identified with persons, businesses, or events significant to local, State, or National history;
- Embodies distinctive characteristics of style, type, period, or method of construction or is a valuable example of the use of indigenous materials or craftsmanship;
- Represents the notable work of a builder, designer, engineer, or architect; and/or
- Is unique in location or has a singular physical characteristic that represents a familiar visual feature of a neighborhood, community, or the city.

Designate a district as historic if it:

- Is a geographically definable area possessing a concentration or continuity of sites, buildings, structures, or objects as unified by past events or aesthetically by plan or physical development; or

- Identifies relevant key neighborhoods either as historic districts or merit districts. Designate accordingly if 50% of property owners in the proposed district agree to the designation.
- An “Historic District” means any area containing a concentration of improvements that has a special character, architectural importance, historical interest, or aesthetic value, which possesses integrity of location, design, setting, materials, workmanship, feeling, and association or which represents one or more architectural periods or styles typical to the history of Lodi.
- A “Merit District” recognizes a district’s history but does not provide for a regulatory structure at this time. The structures of these districts may not be architecturally significant, but the role that these neighborhoods have played in the city’s development, the cultural and economic conditions that resulted in the construction of these neighborhoods and the stories surrounding them make them an important part of the city’s history for which they should be acknowledged and celebrated.

**C-P20** Follow preservation standards outlined in the current *Secretary of the Interior’s Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings*, for structures listed on the National Register of Historic Places or California Register of Historical Resources.

**C-P21** Coordinate historic preservation efforts with other agencies and organizations, including the Lodi Historical Society, San Joaquin County Historical Society and other historical organizations.

## Hydrology and Water Quality

*See Chapter 3: Growth Management and Chapter 6: Parks, Recreation, and Open Space for water-related policies that address water supply and conservation; and riparian areas within open spaces, respectively.*

**C-P22** Monitor water quality regularly to ensure that safe drinking water standards are met and maintained in accordance with State and EPA regulations and take necessary measures to prevent contamination. Comply with the requirements of the Clean Water Act with the intent of minimizing the discharge of pollutants to surface waters.

**C-P23** Monitor the water quality of the Mokelumne River and Lodi Lake, in coordination with San Joaquin County, to determine when the coliform bacterial standard for contact recreation and the maximum concentration levels of priority pollutants, established by the California Department of Health Services, are exceeded. Monitor the presence of pollutants and variables that could cause harm to fish, wildlife, and plant species in the Mokelumne River and Lodi Lake. Post signs at areas used by water recreationists warning users of health risks whenever the coliform bacteria standard for contact recreation is exceeded. Require new industrial development to not adversely affect water quality in the Mokelumne River or in the area’s groundwater basin. Control use of potential water contaminants through inventorying hazardous materials used in City and industrial operations.

**C-P24** Regularly monitor water quality in municipal wells for evidence of contamination from dibromochloropropane (DBCP), saltwater intrusion, and other toxic substances that could pose a health hazard to the domestic water supply. Close or treat municipal wells that exceed the action level for DBCP.

**C-P25** Minimize storm sewer pollution of the Mokelumne River and other waterways by maintaining an effective street sweeping and cleaning program.

- C-P26** Require, as part of watershed drainage plans, Best Management Practices, to reduce pollutants to the maximum extent practicable.
- C-P27** Require all new development and redevelopment projects to comply with the post-construction Best Management Practices (BMPs) called for in the Stormwater Quality Control Criteria Plan, as outlined in the City's Phase 1 Stormwater NPDES permit issued by the California Water Quality Control Board, Central Valley Region. Require that owners, developers, and/or successors-in-interest to establish a maintenance entity acceptable to the City to provide funding for the operation, maintenance, and replacement costs of all post-construction BMPs.
- C-P28** Require, as part of the City's Storm Water NPDES Permit and ordinances, the implementation of a Grading Plan, Erosion Control Plan, and Pollution Prevention Plan during the construction of any new development and redevelopment projects, to the maximum extent feasible.
- C-P29** Require use of stormwater management techniques to improve water quality and reduce impact on municipal water treatment facilities.
- C-P30** Protect groundwater resources by working with the county to prevent septic systems in unincorporated portions of the county that are in the General Plan Land Use Diagram, on parcels less than two acres.
- C-P31** Reduce the use of pesticides, insecticides, herbicides, or other toxic chemical substances by households and farmers by providing education and incentives.

## Energy and Climate Change

- C-P32** Prepare and adopt a comprehensive climate action plan (CAP). The CAP should include the following provisions:
- An inventory of citywide greenhouse gas emissions,
  - Emissions targets that apply at reasonable intervals through the life of the CAP,
  - Enforceable greenhouse gas emissions control measures,
  - A monitoring and reporting program to ensure targets are met, and
  - Mechanisms to allow for revision of the CAP, as necessary.
- C-P33** Promote incorporation of energy conservation and weatherization features into existing structures. Update the Zoning Ordinance and make local amendments to the California Building Code, as needed, to allow for the implementation of green building, green construction, and energy efficiency measures.
- C-P34** Encourage the development of energy efficient buildings and communities. All new development, including major rehabilitation, renovation, and redevelopment projects, shall incorporate energy conservation and green building practices to the maximum extent feasible and as appropriate to the project proposed. Such practices include, but are not limited to: building orientation and shading, landscaping, and the use of active and passive solar heating and water systems. The City may implement this policy by adopting and enforcing a Green Building Ordinance.
- C-P35** Reduce energy consumption within City government facilities and motor fleets.
- C-P36** Encourage the use of passive and active solar devices such as solar collectors, solar cells, and solar heating systems into the design of local buildings. Promote voluntary participation in incentive programs to increase the use of solar photovoltaic systems in new and existing residential, commercial, institutional, and public buildings.

**C-P37** Work with the California Energy Commission and other public and non-profit agencies to promote the use of programs that encourage developers to surpass Title 24 Energy Efficiency standards by utilizing renewable energy systems and more efficient practices that conserve energy, including, but not limited to natural gas, hydrogen or electrical vehicles. Offer incentives such as density bonus, expedited process, fee reduction/waiver to property owners and developers who exceed California Title 24 energy efficiency standards.

**C-P38** Develop, adopt, and implement a heat island mitigation plan to reduce carbon dioxide emissions, smog, and the energy required to cool buildings. This plan should contain requirements and incentives for the use of cool roofs, cool pavements, and strategic shade tree placement, all of which may result in as much as 6-8° F temperature decrease from existing conditions.

**C-P39** Encourage the planting of shade trees along all City streets and residential lots (but, particularly in areas that currently lack street trees) to reduce radiation heating and greenhouse gases. Develop a tree planting informational packet to help future residents understand their options for planting trees.

**C-P40** Promote public education energy conservation programs that strive to reduce the consumption of natural or human-made energy sources.

**C-P41** Post and distribute hard-copy and electronic information on currently available weatherization and energy conservation programs.

## Air Quality

*See Chapter 2: Land Use, Chapter 4: Community Design and Livability, and Chapter 5: Transportation for related policies that seek to improve air quality and reduce emissions through land use, transportation, and urban design strategies.*

**C-P42** Require all construction equipment to be maintained and tuned to meet appropriate EPA and CARB emission requirements and when new emission control devices or operational modifications are found to be effective, such devices or operational modifications are to be required on construction equipment.

**C-P43** Continue to require mitigation measures as a condition of obtaining permits to minimize dust and air emissions impacts from construction.

**C-P44** Require contractors to implement dust suppression measures during excavation, grading, and site preparation activities. Techniques may include, but are not limited to:

- Site watering or application of dust suppressants;
- Phasing or extension of grading operations;
- Covering of stockpiles;
- Suspension of grading activities during high wind periods (typically winds greater than 25 miles per hour); and
- Revegetation of graded areas.

**C-P45** Cooperate with other local, regional, and State agencies in developing and implementing air quality plans to achieve State and Federal Ambient Air Quality Standards and address cross-jurisdictional and regional transportation and air quality issues.

**C-P46** Use the San Joaquin Valley Air Pollution Control District's (SJVAPCD) Guide for Assessing and Mitigating Air Quality Impacts for determining and mitigating project air quality impacts and related thresholds of significance for use in environmental documents. The City shall consult with the

SJVAPCD during CEQA review for projects that require air quality impact analysis and ensure that the SJVAPCD is on the distribution list for all CEQA documents.

**C-P47** Support recommendations to reduce air pollutants found in the San Joaquin Valley Air Pollution Control District (SJVAPCD) local attainment plans and use its regulatory authority to mitigate “point” sources of air pollution (e.g., factories, power plants, etc.).

**C-P48** Ensure that air quality impacts identified during the project-level CEQA review process are fairly and consistently mitigated. Require projects to comply with the City’s adopted air quality impact assessment and mitigation process, and to provide specific mitigation measures as outlined in policies of Chapter 5: Circulation.

**C-P49** Assess air quality mitigation fees for all new development, with the fees to be used to fund air quality programs.

**C-P50** Require the use of natural gas or the installation of low-emission, EPA-certified fireplace inserts in all open hearth fireplaces in new homes. Promote the use of natural gas over wood products in space heating devices and fireplaces in all existing and new homes. Follow the guidelines set forth in San Joaquin Valley Air Pollution Control District’s Rule 4901.

**C-P51** Review, support, and require implementation (as applicable) of San Joaquin Valley Air Pollution Control District guidance and recommendations (including those identified in the Guide for Assessing and Mitigating Air Quality Impacts) in regards to several key issues including:

- Environmental Assessment;
- Air Quality Mitigation Agreements;
- Integrated Planning;
- Air Quality Education;
- Congestion Management/Transportation Control Measures;
- Toxic and Hazardous Pollutant Emissions;

- Fugitive Dust and PM10 Emissions; and
- Energy Conservation and Alternative Fuels.

**C-P52** Require new sensitive uses proposed to be located within 500 feet of high volume traffic routes where daily vehicle counts exceed 100,000, to use an HVAC system with filtration to reduce/mitigate infiltration of vehicle emissions as warranted by exposure analysis.

**C-P53** Require industrial development adjacent to residential areas to provide buffers and institute setback intended to ensure land use compatibility in regards to potential Toxic Air Contaminant exposure.
